

Build a prototype for Packaged meals in uber eats.
The prototype is for demo only. It needs to be interactive.

1. Entry point: add a tab between "Ride" and "Grocery" called "Packaged meals"

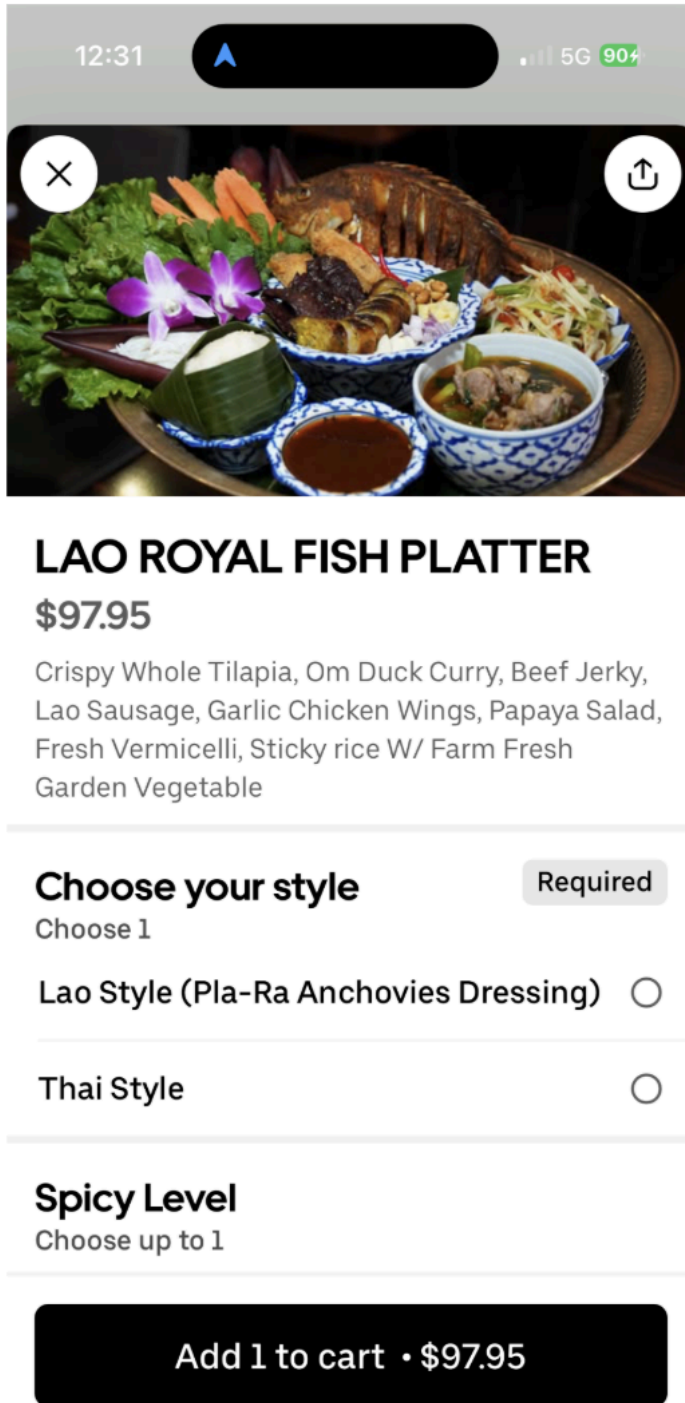

2. The tab structure is similar to the "All" tab above
 - At the top of the tab, it has filters: All (default), Three-day ready (text color is gold), Mix and match, Healthy, Protein, Low carb, Low calories...select a filter will change the restaurant list below.

- Click Mix and match, show subtitle: "Order from restaurants en route, no extra delivery fee"
 - Next to the notification/bell icon, it has a preference icon, includes: overall preference: healthy, low calories, high protein, do not select any by default. Dietary restriction: None, vegan, vegetarian, other: do not select any by default. Protein types: pork, beef, chicken, seafood, plant...do not select any by default. Other things you seem fit.
 - The preference page has an AI button, you can describe your preference/restrictions to ai, and it will save the preference accordingly
 - Restaurant list: It has different sections like "Fresh seasonal vegetable", "New sandwiches in town" and things like that, each section features multiple restaurants
3. Restaurant page: looks like the current restaurant page, except for:
- Remove group order; remove delivery fee and earliest arrival, put "Order by 2pm, get delivery today"; change the \$12 off \$45+ to "Order more than 5 meals, get 10% off"
 - Add a "Mix and match" horizontal gallery at the bottom of the restaurant page. Text below the mix and match title: "Order from restaurants en route, no extra delivery fee". The gallery scrolls shows a couple of restaurants.

4. Meal page

Clicking open a thumbnail will show you what this meal includes, it should show details like ingredients, protein, fiber grams, calories, flavors things like that

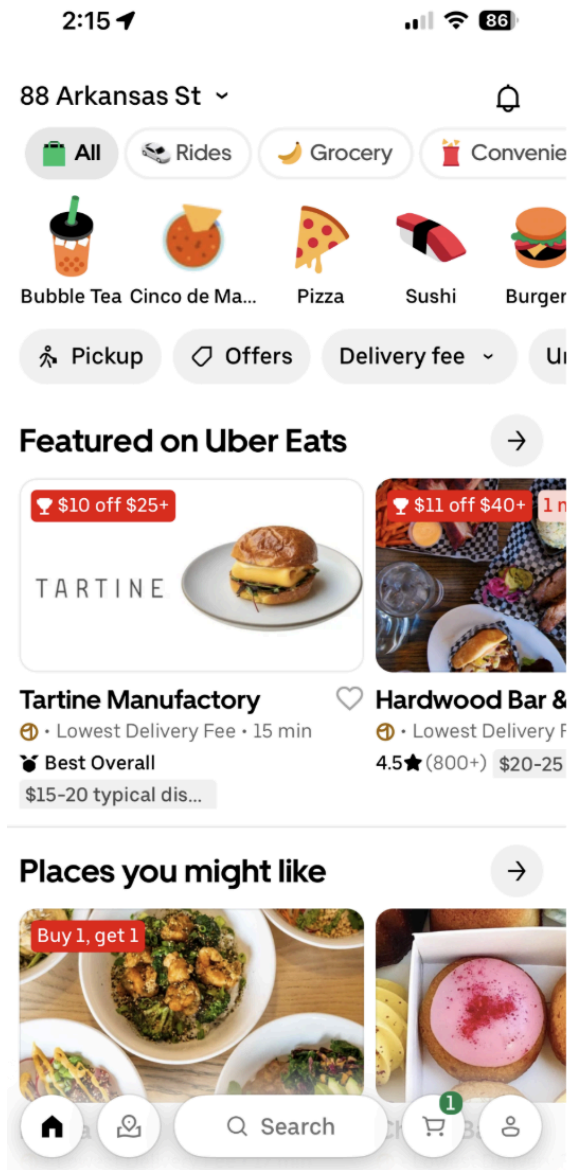

5. AI search: on the search bar at the bottom, put an AI icon on it

Click to show a chat bottom sheet, you can use text or voice to tell AI what you want

E.g.:

- If you say: show me healthy food, it changes the restaurant list
- If you say: Pick 8 meals for me and 2 breakfasts, no fried food, it'll add things automatically to the cart
- If the meal is picked by AI, the cart also has a AI chat entry point to give further demands

6. Cart:

- Mostly look like this, allows bulk select: users can choose one or multiple restaurants and some items from them to check out together or separately
- Separate restaurants into different sections on the same page: Restaurants, packaged meals, three-day ready

- Don't show the "send as gift", "save with uber one", "add a note"
